

Why the SPMO replica beat the S&P 500 after 2024: low-turnover hold-and-drift, idiosyncratic alpha, concentrated names

A | Mechanism decomposition
Rebal/Drift (semi-annual hold-and-drift)
dominates the POST ≥ 2024 excess

B | Idiosyncratic alpha, not momentum factor
Alpha turns positive post-2018; UMD loading
stable ~ 0.5 (not surging) into 2024-25

C | 2024 excess: a few names drive it all
Top-3 (NVDA/AVGO/META) $\approx$ entire top-10 excess;
concentration, not breadth
